

## Greedy Solutions

Solution 1:

Time Complexity :  $O(n)$   
Space Complexity:  $O(1)$

```
import java.util.*;  
  
class Solution {  
  
    static int BalancedPartition(String str, int n){  
  
        if (n == 0)  
            return 0;  
  
        int r = 0, l = 0;  
        int ans = 0;  
        for(int i = 0; i < n; i++) {  
            if (str.charAt(i) == 'R'){  
                r++;  
            }  
            else if (str.charAt(i) == 'L'){  
                l++;  
            }  
  
            if (r == l){  
                ans++;  
            }  
        }  
  
        return ans;  
    }  
  
    public static void main(String[] args){  
        String str = "LLRRRLLLRL";  
        int n = str.length();  
  
        System.out.print(BalancedPartition(str, n) + "\n");  
    }  
}
```

## Solution 2 :

Time Complexity : o(1)

Space Complexity: o(1)

```
class Solution {  
  
    public static int kthOdd(int[] range, int K) {  
  
        if (K <= 0)  
            return 0;  
  
        int L = range[0];  
        int R = range[1];  
  
        if ((R & 1) > 0) {  
            int Count = (int) Math.ceil((R - L + 1) / 2);  
            if (K > Count)  
                return 0;  
            else  
                return (R - 2 * K + 2);  
        } else {  
            int Count = (R - L + 1) / 2;  
            if (K > Count)  
                return 0;  
            else  
                return (R - 2 * K + 1);  
        }  
    }  
  
    public static void main(String args[]){  
        int[] p = { -10, 10 };  
        int k = 8;  
        System.out.println(kthOdd(p, k));  
    }  
}
```

## Solution 3 :

priyanshi082005@gmail.com

Time Complexity :  $O(n)$

Space Complexity:  $O(n)$

```
import java.util.Arrays;
public class Main {
    public static char[] lexo_small(int n, int k){
        char arr[] = new char[n];
        Arrays.fill(arr, 'a');
        for (int i = n - 1; i >= 0; i--) {
            k -= i;
            if (k >= 0) {
                if (k >= 26) {
                    arr[i] = 'z';
                    k -= 26;
                }
                else {
                    arr[i] = (char)(k + 97 - 1);
                    k -= arr[i] - 'a' + 1;
                }
            }
            else
                break;
            k += i;
        }
        return arr;
    }

    public static void main(String[] args){
        int n = 5, k = 42;

        char arr[] = lexo_small(n, k);

        System.out.print(new String(arr));
    }
}
```

priyanshi082005@gmail.com

### Solution 4 :

Time Complexity :  $O(n)$

Space Complexity:  $O(1)$

```
class Solution {  
    static int maxProfit(int prices[], int n)  
{  
        int buy = prices[0], max_profit = 0;  
        for (int i = 1; i < n; i++) {  
            if (buy > prices[i])  
                buy = prices[i];  
            else if (prices[i] - buy > max_profit)  
                max_profit = prices[i] - buy;  
        }  
        return max_profit;  
    }  
  
    public static void main(String args[]) {  
        int prices[] = { 7, 1, 5, 6, 4 };  
        int n = prices.length;  
        int max_profit = maxProfit(prices, n);  
        System.out.println(max_profit);  
    }  
}
```

### Solution 5 :

Time Complexity :  $O((N-1)c(K-1))$

(Here 'c' here depicts combinations i.e.  $((n-1)!/((n-k)!*(k-1)!)$  Where N is the number of elements of the array and K is the number of divisions that we are having)

Space Complexity:  $O(n)$

```
class Solution {  
    public static int ans = 10000000;  
    public static void solve(int a[], int n, int k,  
                           int index, int sum, int maxsum){
```

priyanshi082005@gmail.com

```
if (k == 1) {  
    maxsum = Math.max(maxsum, sum);  
    sum = 0;  
    for (int i = index; i < n; i++) {  
        sum += a[i];  
    }  
    maxsum = Math.max(maxsum, sum);  
    ans = Math.min(ans, maxsum);  
    return;  
}  
sum = 0;  
for (int i = index; i < n; i++) {  
    sum += a[i];  
    maxsum = Math.max(maxsum, sum);  
    solve(a, n, k - 1, i + 1, sum, maxsum);  
}  
}  
public static void main(String[] args){  
    int arr[] = { 1, 2, 3, 4 };  
    int k = 3; // K divisions  
    int n = 4; // Size of Array  
    solve(arr, n, k, 0, 0, 0);  
    System.out.println(ans + "\n");  
}  
}
```
